

2

- a) There appears to be no difference in the lengths of time until disease progression in the vitamin C and the placebo groups. (In fact, the vitamin C curve is lower than the placebo curve.)
- b) Median time to disease progression was approximately 3 months in the vitamin C group and 4.5 months in the placebo group.
- c) The authors found no significant differences in survival between the groups. This was expected from the little difference in disease progression between the groups.

4

Yes, group T2b-c and T3-4 (the lower solid line, not the upper). Group T2b-c is 50 months and T3-4 is 37 months.
